

PatronPro Automation Session Checkpoint

Test onboarding account automation, website optimization proof, Slack recorder, and
Brigitte fit check

Date: 2026-06-12

Branch: feature/liverpool-digital-docs-automation

Epic: ppweb-07o

Prepared by: Óscar Betancourt

Executive Summary

Checkpoint: PatronPro onboarding automation is now split into proven API actions, browser-proven UI actions, and client/manual gates, with website optimization proven on test onboarding account 01.

Top line

We can automate calendar owner/activation/rules, Brand Boards, GHL/Supabase read QC, main onboarding appointment creation, and lead-objection tracking. Browser automation covers GHL surfaces with no supported public API: website HTML save, Add Contact Language/DND configuration, and Email Services domain setup.

Manual gates remain for Twilio/A2P, Stripe, Cloudflare/DNS verification, final publish/activation, and client sign-off.

Important positioning

The website SEO/GEO and image optimization workflow is proven on the test account preview and should be productized in Carlos' app as a safe reuse-existing-images path. Existing AI images should be optimized before paying to regenerate images.

API vs Browser vs Manual

API-proven

- Calendar owner assignment, activation, and standard booking rules.
- Brand Board create/update/readback.
- Read-only Supabase + GHL QC.
- PatronPro MAIN onboarding appointment creation.
- MAIN lead quality/status/objection custom fields.

Browser-proven

- GHL website custom-code block save.
- Add Contact customization: Language required, DND removed.
- Email Services domain setup to the DNS-record screen.

Manual/client-gated

- Twilio Trust Center/A2P, phone, Shaken/Stir, CNAM, Voice Integrity.
- Stripe account, bank, and payout schedule.
- Cloudflare/registrar DNS verification.
- Landing form after Twilio approval, final publish, account activation, client access.

Test Account Status

Current state

Agent QC on 2026-06-11 returned **12 pass / 11 fail** for test onboarding account 01 (Liverpool Digital). The failures are mostly expected setup gates: domain, phone/Twilio, email sender, landing publication evidence, Stripe, client OK, account approval, landing custom values, workflow proof, and activation gate.

Item	Status	Note
Calendars	Done	Owner, active, free-slot QA, booking rules.
Brand Board	Done	Main #471F23, Accent #F69309, Complementary #2F1417.
Website optimization	Done	Optimized HTML with AVIF/WebP/JPEG, social preview, JSON-LD, and GHL preview save proof.
Domain/email/phone/Stripe	Pending	Manual/client-gated or DNS/Twilio gated.

Main onboarding appointment

Appointment **Cxa6iMN4am9r1XUdJWWS** was rescheduled in PatronPro MAIN to Friday 2026-06-12, 11:00-12:00 CDMX, assigned to Oscar Betancourt with notifications enabled. GHL readback shows the same instant as 10:00-11:00 -07:00.

Website, SEO/GEO, and Lighthouse

Optimization design

- Optimize existing AI images before regenerating paid AI images.
- Generate 640w, 960w, 1440w variants.
- Publish AVIF first, WebP second, compressed JPEG fallback last.
- Hero image eager/high priority; below-fold images lazy.
- Add 1200x630 social preview for WhatsApp, Messenger, Open Graph, and Twitter/X.
- Add canonical, meta, robots, JSON-LD service data, and stable service anchors.

Lighthouse evidence

Run	Perf	LCP	Total transfer	Images
Desktop before	75	3.9s	8465.1 KiB	8070.3 KiB
Desktop after	94	1.3s	1173.0 KiB	776.2 KiB
Mobile before	65	21.3s	8464.9 KiB	8070.0 KiB
Mobile after	66	8.2s	1096.2 KiB	700.0 KiB

Evidence: the after-run used the optimized GHSL preview HTML saved through WSL Profile 9. Publish was not clicked; this is test-preview proof, not final live-client activation.

Slack Recorder and Bot

Pattern

Use a dedicated Slack user, **PatronPro Recorder**, for repeat tests and production-like recording. Slack slash commands are only the control plane; the recorder worker owns CDP/browser, FFmpeg, Huddle state, stop/leave, metadata, and status.

Status

- Command lifecycle exists as a guarded MVP.
- Dry-run guard and channel allowlist were set for FSN1 rollout.
- Transcription fallback is Groq -> Deepgram -> OpenAI -> local; local Whisper is not configured.
- Slack MCP and the Bolt app are separate layers by design.

Remaining controls

Install/update slash-command manifest, verify dry-run commands in the approved test channel, then run live recorder tests only after explicit approval.

Brigitte Fit Check

Current interpretation

Brigitte compared PatronPro to pdfFiller, pays about \$100/year, mentioned another Facebook tool, and sees PatronPro as expensive. If her only need is document filling and signatures, she may not be the right PatronPro client right now.

Recommended reply direction

Acknowledge pdfFiller as a good document tool. Reframe PatronPro as the broader client-flow system: landing page, form, calendar, lead capture, calls, SMS, email, appointments, pipeline, estimates, invoices/payments, reminders, and follow-up.

Boundary

Do not promise social media post creation, social account management, AI agents, or advanced automations unless Carlos/Duncan approve exact wording.

Tracking

MAIN GHL lead quality/status/objection fields were created and Brigitte was marked warm, engaged, with objection reason too expensive.

Gotchas and Next Steps

Reusable gotchas

- Use WSL Profile 9 only for PatronPro/GHL browser automation.
- Generated website code does not update GHL builder automatically.
- GHL Media rejected AVIF uploads; Supabase Storage public assets worked for AVIF/WebP/JPEG derivatives.
- Calendar list openHoursCount is not authoritative; use free-slots QA.
- GHL appointment readback may use a different timezone offset for the same instant.
- Email Services setup currently needs browser automation.
- Do not insert landing_form before Twilio approval.

Next steps

1. Run the test onboarding account 01 rehearsal on Friday 2026-06-12 at 11:00 AM CDMX.
2. Complete Cloudflare DNS and verify email/domain in GHL.
3. Finish Twilio/A2P and Stripe with the client/operator present.
4. Run manual QA against the onboarding checklist.
5. Optimize the remaining large logo PNG; it is now the main Lighthouse image payload after the AI photos were reduced.
6. Present the optimizer as a safe app proposal with dry-run/readback, not as an immediate live deployment.
